# **GEAR COUPLINGS SERIES M**

**SEISA Gear, Ltd.**

Affiliated company of Sumitomo Heavy Industries, Ltd.

SEISA Couplings offer

# FULL LINE OF COUPLINGS

As the world's leading manufacturer of Couplings and gears, gear drives, SEISA offers full line of Couplings as standardized types based on the abundant experiences for over 80 years in the industry.

## DC

### DC Coupling

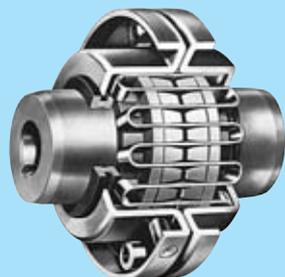

Lubrication-free, non-backlash, maintenance-free

## GC

### GC Coupling

Compact sized coupling with high torque transmitted capability developed from our original technology

## SF

### SF Coupling

Grid-shaped spring to absorb shock load  
(Under the licences from FALK corporation, USA)

SEISA Couplings have been applied to every industry around the world, enjoying high reputation on their reliability.

# Seisa Coupling Comparisons

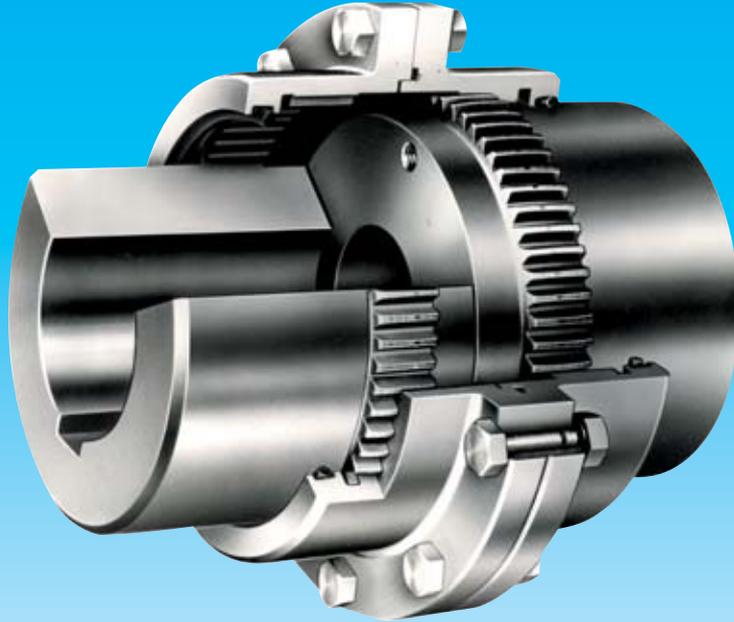

The features of DC, GC and SF Couplings are graphically presented here.

Select the Coupling optimum for your application.

# GC Coupling

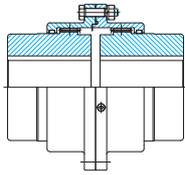

## Features of GC Coupling

1. Prime mover torque is fully transmitted despite the presence of misalignment (offset and Angular) of shafts to a certain extent.
2. The Coupling automatically adjusts and absorbs parallel offset or tilting of the coupled shafts even if it occurs during operation, avoiding excessive loading on shaft and bearing and thus protecting the machine.
3. The flexible Coupling using crowned teeth features high durability and excellent wear resistant .
4. Separable Coupling center and case facilitates assembly and disassembly. Besides, compact lightweight design saves the space for installation.
5. Unlike other flexible Couplings, GC Coupling produces no difference of rotation angles between two shafts due to Coupling deflection, making it the optimum choice for line shaft Coupling, high speed and heavy duty applications.

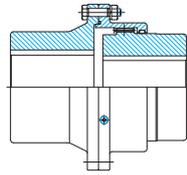

## Features of M series

1. The configurations are the same as the types SS, SE, CC and CE specified in JIS B1453 "Geared type shaft coupling". The catalog shows the four types adding prefix GC and suffix M to JIS expression, GC-SSM, GC-SEM, GC-CCM and GC-CEM, as well as GC-SMM, GC-SAM, GC-CAM, GC-SMV, GC-CMV and GC-EEM types.
2. The size number is indicated by the Coupling Case outside diameter. Bore diameter for shaft is in compliance with JIS, while Coupling O.D. is made more compact.  
When compared with JIS Coupling, therefore, the product is more compact in size and lighter in weight, contributing to your cost savings.
3. As Coupling Center is longer relative to Coupling Case width, shafts can be easily aligned by moving the Coupling Case within the range of boss length. This configuration also makes the teeth inspection easier.
4. Upright type (GC-SMV, GC-CMV), spacer type (GC-SAM, GC-CAM) and coupling with the oil seal cover to prevent oil leakage from key way are standardized.
5. The types GC-MH are also standardized, whose power transmitted capacities are increased by heat treatment.

# Construction of GC coupling

## 1. Construction

GC coupling is constructed by the mesh between internal spur gear of the Coupling Case and crowned external spur gear of the Coupling Center. Working surface, top and bottom land of involute profile teeth are designed with crowns on all working portions of the teeth, so they can slide freely, and ensure uniform speed and smooth power transmission.

Having two gear meshes, GC-SSM and GC-CCM can always keep the case in the neutral position and transmit power smoothly despite offset alignment, Angular misalignment and axial gap. Having single gear mesh, GC-SEM and GC-CEM can accommodate angular misalignment and axial gap. As shown in Figure 5, normally two units should be applied in combination using an floating shaft.

## 2. Major parts and their materials

### GC-SSM type

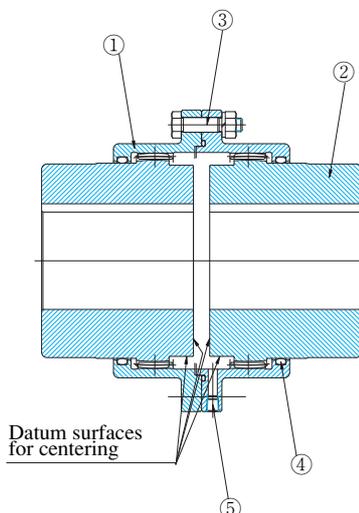

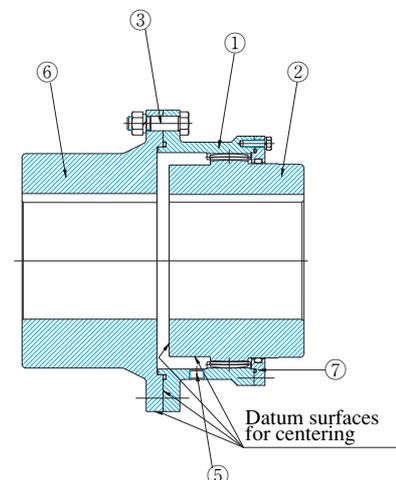

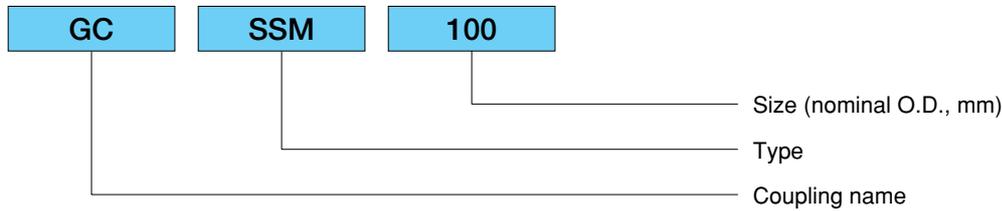

Table 1

GC-SSM, SEM types	Part name	GC-CCM, CEM types
① S45C	Coupling Case	S45C or SCMn2
② S45C	Coupling Center	S45C or SCMn2
③ SCM440	Reamer bolt	SCM440
④ Nitrile rubber	O-ring	Nitrile rubber
⑤ SCM435	Oil plug	SCM435
⑥ S45C	Rigid	S45C or SC46
⑦	Side cover	SS400

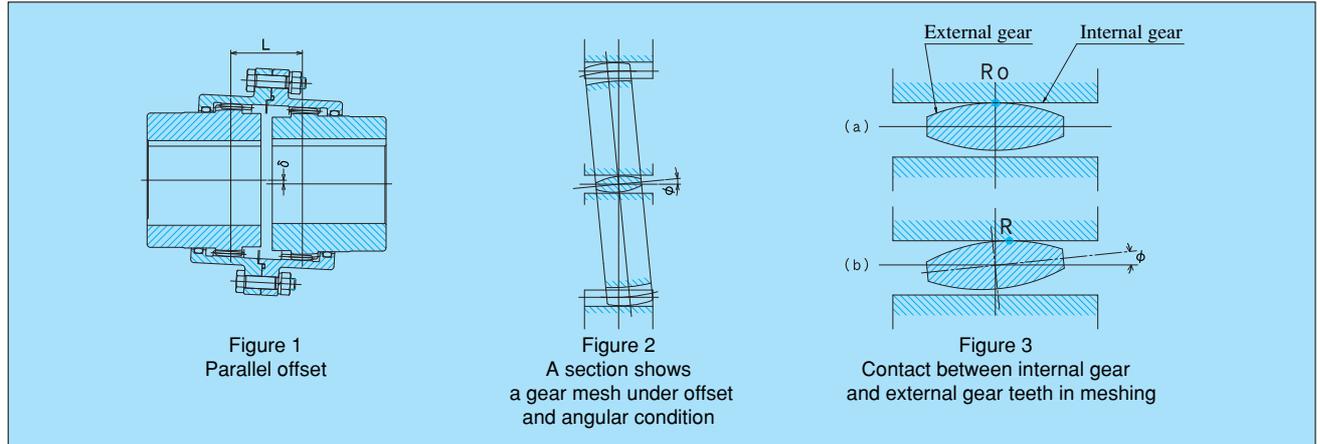

### GC-CEM type

# GC Coupling nomenclature

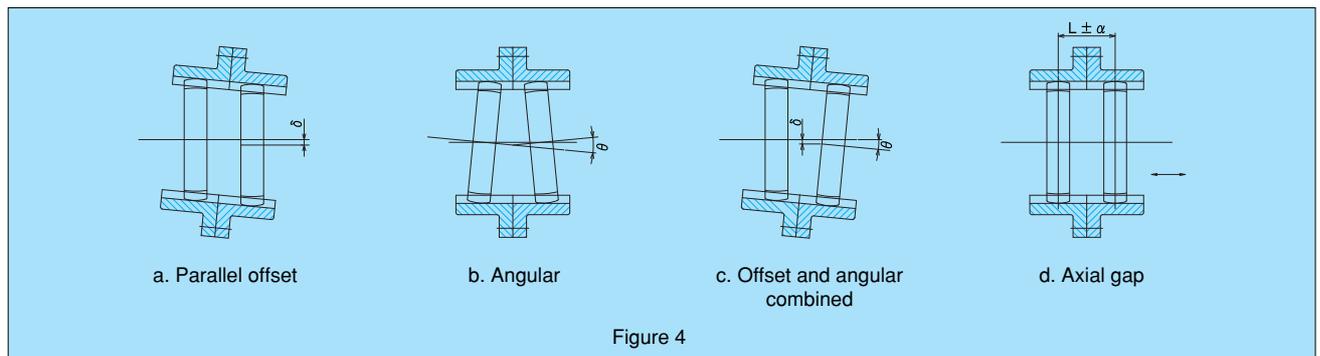

# GC Coupling flexibility

When offset misalignment exists, the coupling gear tooth tilts by  $\tan \phi = \delta / L$  as shown in Figure 1. When the shafts are concentric, the gear tooth is in contact at the crowned tooth center ( $R_o$ ) as shown in Figure 3(a). However, when the shafts have offset or angular misalignment after installation the gear tooth comes into contact at the point ( $R$ ) away from the tooth center as shown in Figure 3(b). The larger the tilting angle is, the remoter the contact

point goes away from the center. Thus, the contact on arced surface ensures free and smooth meshing between internal gear and external gear under offset and angular misalignment. Our GC Couplings are designed and manufactured to have adequate crowning and backlash so that they can work freely and smoothly within allowable range.

## 1. Examples of misalignment

## 2. Allowable misalignment

The values in the tables below indicate the structurally allowable limits. It is, therefore, practically recommended that the alignment should be made as accurately as possible according to the service conditions such as the place of application, type of machine, service speed, etc. Recommended alignment target for longer working life: Less than 1/10 of the values shown in the table 2&3 below.

(a) Angular misalignment

Table 2

Type	Angular ( $\theta$ )
GC-SSM,GC-SMM	3°
GC-CCM	2°
GC-MV	0.5°

Type	Angular ( $\theta$ )
GC-SEM	1.5°
GC-CEM	1°

$\theta = 2 \phi$

(b) Offset misalignment and axial gap

Table 3

(Unit : mm)

GC-SSM type, GC-SMM type, GC-CCM type

Size No.	offset	Axial gap	Size No.	offset	Axial gap	Size No.	offset	Axial gap
100	0.75	-0.5~+1.0	355	3.0	-0.5~+5.5	1250	9.0	-0.5~+14.0
112	1.0	-0.5~+2.0	400	3.0	-0.5~+6.5	1400	10.0	-0.5~+16.5
125	1.0	-0.5~+2.5	450	3.0	-0.5~+5.0	1600	11.0	-0.5~+18.0
140	1.25	-0.5~+2.5	500	3.5	-0.5~+6.0			
160	1.25	-0.5~+3.0	560	4.0	-0.5~+6.5			
180	1.5	-0.5~+3.0	630	4.5	-0.5~+8.0			
200	1.5	-0.5~+3.0	710	5.0	-0.5~+8.5			
224	1.5	-0.5~+4.0	800	5.5	-0.5~+9.5			
250	2.0	-0.5~+4.0	900	6.5	-0.5~+10.5			
280	2.0	-0.5~+4.5	1000	7.0	-0.5~+12.0			
315	2.5	-0.5~+5.5	1120	8.0	-0.5~+13.0			

GC-SMV type, GC-SMVH type

Size No.	offset	Axial gap
100	0.6	-0.5~+1.0
112	0.6	-0.5~+1.0
125	0.6	-0.5~+1.5
140	0.6	-0.5~+1.5
160	0.6	-0.5~+1.5
180	0.6	-0.5~+1.5
200	0.6	-0.5~+1.5
224	0.6	-0.5~+2.0
250	1.0	-0.5~+2.0
280	1.0	-0.5~+2.5
315	1.0	-0.5~+3.0
355	1.0	-0.5~+3.0
400	1.0	-0.5~+3.5

Note: SEM and CEM types cannot accommodate the offset ( $\delta$ ) with a single unit. For these types, the axial gap ( $\alpha$ ) is a half of the value shown in the table.

SEM and CEM types should be applied with the two units in combination, using floating shaft as shown in Figure 5. In this case, offset misalignment should be determined from the following equation.

$$\tan \phi = \delta / L \text{ or } \delta = L \times \tan \phi$$

Usually taking as  $L \doteq L'$

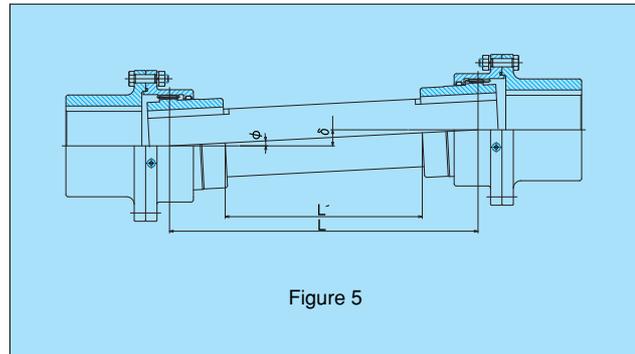

Figure 5

## How to select

### 1. Determination of service factor $S_1$

⇒ According to Table 4 and Table 5

### 2. Determination of offset and Angular factor $S_2$

● In case that the shafts are designed without misalignment and are carefully aligned at the installation,  $S_2=1.0$

● When the coupled shafts are so designed as to have offset or angular misalignment, determine  $S_2$  as per Table 6

### 3. Determination of reversing factor $S_3$

⇒ One-way rotation  $S_3=1.0$

For reversing service  $S_3=1.5$

### 4. Calculation of transmitted capacity H or T

$$H = \frac{H_0 \times S_1 \times S_3}{S_2} \quad H_0 = \text{Transmitted power (kW)}$$

$$T = \frac{T_0 \times S_1 \times S_3}{S_2} \quad T_0 = \text{Transmitted torque (N-m, kgf-m)}$$

### 5. Size selection

⇒ Use the transmitted capacity tables on pages 12-15, 21 and 22.

(When rotational speed is not found in the tables, use interpolation to determine.)

### 6. Check bore

⇒ Use the dimensions tables on pages 16-24.

### 7. Check of maximum rotational speed

⇒ Use the transmitted capacity tables on pages 12-15, 21 and 22.

Table 4 Service factor ...  $S_1$

Driving machine \ Driven machine	Driven machine		
	Uniform load	Variable load	Shock load
Uniform load	1.0	1.5	2.5
Light variable load	1.35	1.85	2.8
Variable load	1.7	2.2	3.0

### Types of driving machine

- Uniform load ..... Equipment using steam turbine or fluid coupling, and the motors excluding those mentioned below.
- Light variable load ..... Motors with speed control (such as VVVF motor), equipment with belt drive or with frequent start and stop operations.
- Variable load ..... Diesel engines with less than 6 cylinders.

### Types of driven machine

- Uniform load ..... Centrifugal blower, centrifugal compressor, centrifugal pump, etc.
- Variable load ..... Blower, compressor and pump excluding those mentioned above and below, line shaft, reel winder, conveyor, etc.
- Shock load ..... Cement kiln, shear, dryer, press, pulverizer, crane ; and reciprocating compressor, reciprocating pump, etc.

**Table 5 Service factor  $S_1$  for special application**

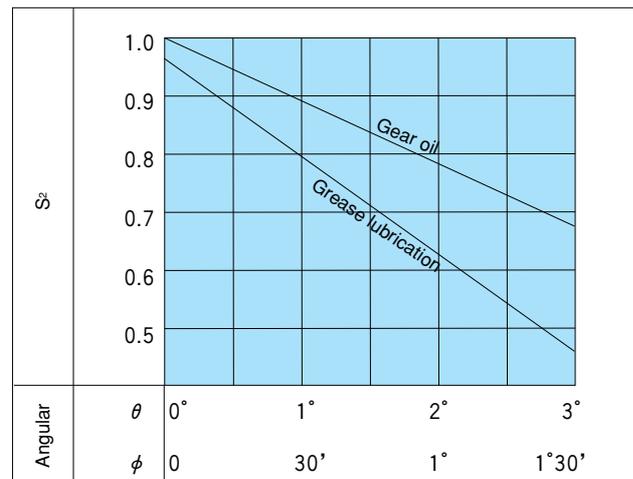

Application condition	Service factor
Shaft system for transmission of high energy such as brake torque	4
Repeated shock loading such as encountered in diesel engine with extremely few cylinders, or in shaft system that frequently performs inching operation	5

Note: In the following cases, select in accordance with the method as described below, not using the table above.

- If a system peak torque ( $T_{max}$ ) occurs less than 1000 times during the expected coupling life use the following formula.  
Selection Torque  $T = 1/2 \times T_{max}$

- Brake applications:  
If the Torque rating of the brake exceeds the motor Torque, use the brake rating.  
As follows:  
Selection Torque  $T = \text{brake torque}$

**Table 6 Offset and Angular misalignment factor  $S_2$**

Calculate the Angular from the following formula to determine  $S_2$ .

$$\tan \phi = \frac{\delta}{L}$$

where,  $\delta$  is amount of offset misalignment.  
L=Shown in Table 7 for standard types SSM, CCM, SMV, and CMV.  
When SEM or CEM is used in combination with floating shaft, use  $L=L'$  (Figo 5).

**Table 7 Dimension L**

SSM, SMV	100	112	125	140	160	180	200	224	250	280	315	355	400
L (mm)	35	39	43	48	53	56	63	69	78	86	114	124	130
CCM, CMV	450	500	560	630	710	800	900	1000	1120	1250	1400	1600	
L (mm)	196	221	246	272	318	351	376	405	472	535	584	681	

[Example 1]

In case of a coupling being used as a shaft coupling for a municipal sewage pump driven by a direct-coupled diesel engine.

**Specifications of Engine:**

Shaft horsepower .....200kW  
 Speed .....650rpm  
 No. of cylinders .....6  
 Shaft diameter .....80mm

**Specifications of Pump:**

Required horsepower .....190kW  
 Speed .....650rpm  
 Shaft diameter .....80mm  
 Alignment;assuming no offset & angular misalignments.

**Selection Steps:**

From Table 4, Service Factor  $S_1$  is 1.7.  
 From Table 6, Offset & Angular Misalignment Factor  $S_2$  is 1.0.  
 From Selection Step 3, Reversing Factor  $S_3$  is 1.0.  
 From Selection Step 4, the basic rating for selection H can be obtained as follows:

$$H = \frac{190 \times 1.7 \times 1.0}{1.0} = 323 \text{ (kW)}$$

Since the starting load does not exceed 200% in this case, the above value can be taken as the basic rating for selection.

Since the operating speed at 650rpm is not listed in the Transmitting Power Ratings on page 12, convert the 323 kW at 650rpm into that at 750rpm as follows:

$$323 \times \frac{750}{650} = 373 \text{ (kW)}$$

From the "Transmitting Power Rating" on page 12, select the unit size SSM224 having the basic rating for selection over 373kW at 750rpm.

Further, considering the maximum bore of Type GC-SSM224 is 100mm, the use of Type GC-SSM224 is finally determined.

[Example 2]

**Driving and Driven Machines:**

An electric motor and a pinion stand for the rolls of a rolling mill

**Specifications of Motor:**

Transmitting horse power .....2,000kW  
 Speed .....0~50/150rpm  
 Shaft diameter .....630mm

**Specifications of Pinion Stand:**

Normal torque .....39tf·m  
 Normal max. torque .....275%  
 Emergency max. torque .....330%  
 Shaft diameter .....630mm

**Selection Steps:**

For service factor, the emergency max. torque of 330% is applied.

For offset and angular misalignment factor, a value of 1.0 is applied tentatively.

It is, however, preferable to allow some margin in the basic rating for selection in view of a 24-hour continuous operation of the machine and possible land subsidence.

$$H = \frac{2000 \times 3.3}{1.0} = 6600 \text{ (kW)}$$

From the "Transmitting Power Rating" on page 13, the unit size CCM 1120 having over 6600kW at 50rpm is obtained, but the larger unit size, GC-CCM1250, is finally selected because of the shaft diameter being 630mm.

Instruction for size selection and usage

- When shaft diameter smaller than minimum bore shown in the Dimensions Table is required, extra delivery time will be needed for custom production.
- Unless otherwise specified, the product is supplied with rough stock bore.  
 When JIS standard key is used with maximum bore diameter, the fitting tolerance should be within the H7n6 interference. Bore can be manufactured to the specified dimension if required. Standard finish tolerance is Class 7. When tapered machining is required, the taper gauge should be basically supplied by customer.
- Strength of interference fit (including key and shrinkage fit, etc.) should be determined by customer.
- For use in high speed revolution, the allowable max. speed of the coupling can be increased by adjusting the alignment and improving the balance of the coupling case.
- When GC Coupling is filled with oil, apply sealing agent on key way to prevent oil leakage from the key way. **Oil seal cover** can be supplied upon request.
- Normal ambient temperature are -10°C to 80°C. In case the temperature is out of the range, please consult with us.
- When rigid combination is used (GC-EEM type), the alignment should be within 5/100mm.

# Installation and maintenance

When installing GC Coupling, carefully follow the instructions below for optimum performance.

- Boring instructions:  
Chuck Coupling Center (or Rigid), and to avoid damage to Coupling Center (or Rigid), use brass sheet between chuck jaws and Coupling Center (or Rigid). Check runout on front face and diameter. Tighten jaws and recheck runout of face and diameter.
- Clean all parts of coupling.
- Mount the Coupling Center on the shaft avoiding the damage to it. Place Coupling Cases, side covers and O-rings on the shaft before mounting the Coupling Center. Seal keyways to prevent from leakage with sealing agent, such as (HERMESEAL SS60F, SUPER THREEBOND, SONY BOND, CEMEDINE BATHCAULK).
- Perform the centering on the datum surfaces as accurately as possible, using feeler gauge and dial indicator. The performance and life of coupling depend upon alignment them, measuring misalignment are recommended less than 1/10 of the value shown in Table 2.
- Make sure there is no dust inside of the coupling case. Tighten the reamer bolts on the mating face evenly while taking care not to damage O-ring.
- When flush bolt is used inside, provide caulking or spot welding

Size No.	100	112	125	140	160	180	200	224	250	280	315	355	400
Tightening Torque N·m (kgf·m)	8.83~10.8 (0.9~1.1)		21.6~26.5 (2.2~2.7)		43.1~53.9 (4.4~5.5)		75.4~94.1 (7.6~9.6)		189~236 (19.3~24.1)				

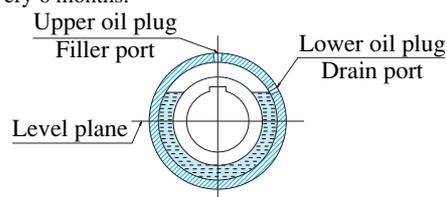

## Maintenance and check

- Check vibration or noise.
- Check lubricant leakage.
- Check tooth for damage.
- Check O-ring for deterioration or damage.
- Check lubricant deterioration.
- Check lubricant quantity loss.

to prevent loosening.  
Supply and replacement of lubricant

### a) Gear oil

Remove the two oil plugs. Supply the recommended lubricant from the upper plug hole until the oil flows out of the lower plug hole. Then, apply sealing agent (same as used on key way) or sealing tape to the plugs and tighten the plugs completely. The initial oil replacement should be done approx. 3 months after start of use. Disassemble the unit, drain the old oil, fully remove the abrasible particles of inside, and then supply the new oil. After the initial replacement, replenish add or change the oil from the plug hole it every 6 months.

### b) Grease

Supply the recommended grease with the amount enough to cover the teeth on the Coupling Case and the Center. Install the coupling and tighten the reamer bolts. Then, fill the additional grease from the oil plug hole using the device like grease gun. The time to change the grease is the same as that of gear oil, so the entire grease should be changed for fresh grease after the inside of the coupling has been cleaned thoroughly by means of disassembly.

Carry out the checks 1 and 2 regularly as they can be done from outside. Compare the status with normal condition. Carry out the rest of the checks periodically by disassembling the unit once in every 6 months. The inspection interval should be made shorter when such extreme conditions exist as high ambient temperature, overloading, reversing service and large misalignment.

# Recommended lubricants

## Lubricants

Use the JIS K2219 industrial-use Class 2 gear oil, (ISO VG680), the AGMA #8EP (ISO VG680) or equivalent.

Use the JIS K2220 centralized lube grease Class 4 No. 1 with extreme-pressure additive, the NLGI #1EP grease, or equivalent. Use the high viscosity gear oil (70-110cst at 98.9°C) especially when such extreme conditions exist as high ambient temperature, overloading, severe reversing and excessive misalignment.

Note: 1. The dimensions concerning the main body, such as E and l<sub>1</sub>, are identical to those in standard type. Please note, however, less allowance is given for eccentricity and deflection angle than standard type because of the reduced dimension e.

# Safety precautions

Before starting to use the product, please read the supplied instruction manual carefully and understand the contents completely. Make sure you have full knowledge about equipment, safety information and precautions prior to use.

In this manual, safety precautions are given as "Warning" and "Caution".

This notation alerts you to the potential danger of serious injury or death in the case of mishandling.

This notation alerts you to the potential danger of bodily harm or damage to properties in the case of mishandling.

Even the precautions given under  if not obeyed, can bring about serious consequences depending on the situation. Make sure to follow the precautions that are all important for your safety.

## 1. On specifications

- \* Never attempt to modify the product. Otherwise the risk of damage or injury may result.
- \* Never use the product in explosive atmosphere. Otherwise the risk of explosion, fire or bodily harm may result.

- \* Never use the product in the application beyond product specifications. Otherwise the risk of damage or injury may result.

## 2. In general

- \* Only the qualified personnel with expertise and ability should be allowed to carry out such tasks as transportation, unpacking, grounding, piping, wiring, operations, maintenance and inspection. Otherwise the risk of electric shock, fire, damage or injury may result.

- \* Never put your fingers or any other substances into the product's opening. Otherwise the risk of electric shock, fire, damage or injury may result.

Requests to customers (exemption from liability)

Further considerations may be required in the following cases: applications over maximum shaft diameters and allowable maximum speed; excessive load fluctuations; repeated impacts; very low running speeds for cranes and the like; reversing units with the turning angles of less than 360 degrees. You are requested to meet with our engineering staff for your best selection. If you purchase our products and use them under out-of-spec running conditions, we are not responsible for machine troubles, accidents and other damages that occur in such unspecified conditions.

\* The design and specifications in this catalog are subject to change for product improvements without notice.
